

**FOR IMMEDIATE RELEASE**

**Velox Technology Partners Announces Velox Java-Based Application Framework 3.1**

**Baltimore, MD – July 29, 2009** – Velox Technology Partners is pleased to introduce Velox 3.1, an enterprise application framework that dramatically reduces the time and effort in creating and delivering enterprise class applications.

Key New Features of the Velox 3.1 Release Include:

- ✓ Extension to the Built-in Data Mining tools with support for advanced query building with graphical output options
- ✓ Addition of a Batch Import Wizard for importing data from spreadsheets or tables with user definable column to field mapping
- ✓ Addition of client side plug-in capability to the Java Plug-in architecture to enable powerful user interface extensions to Velox core UI
- ✓ Role based access definable for each object type

Kevin Cramer, Chief Executive Officer at Velox Technology Partners, “Velox represents a complete rethinking of how enterprise applications can be built, what timeframes they can be built in, and what level of functionality they can exhibit given the short development timeframe. The architects of Velox have taken the two most time consuming aspects, the development of the data and presentation layers, and relegated them to a simple exercise that even non-technical people can do.”

Kevin continues, “It is important to note that this does not imply a simplistic or inflexible application. To the contrary, applications built with Velox have built-in features that are rarely ever seen in enterprise applications, especially when considered in aggregate. Furthermore, the Velox framework is inherently flexible so that making changes to an application are straightforward. When you combine in the Velox Business Process Engine, powerful data mining tools and attractive pricing, Velox represents a comprehensive solution that should be considered for most IT projects.”

**About Velox Technology Partners**

Velox Technology Partners is a leading provider of application development, business process management and business intelligence solutions. The Velox application development framework enables the rapid creation of enterprise class applications in previously unseen timeframes with unprecedented built-in features. Velox TP also enables the rapid creation of business processes with its business process engine that is already used extensively in rigorous, regulated settings. Velox TP’s business intelligence tools enable Velox application users to mine their application data without a need to understand the underlying data model. Velox TP is committed to accelerating software development even further, while providing even more core functionality in the Velox framework and continuing its core philosophy of extreme ease of use and world class technical support.
